

We go a long way renewing our commitment to protect the environment

GLS Webmail

June 2021 | Newsletter

As a globally active express courier, we recognise that we play a role in developing sustainable solutions for transporting goods in an environmentally friendly way, and protecting the environment is an integral part of our logistics strategy.

That is why, in 2008, we created ThinkGreen, our environmental protection program that we pursue every day with undiminished enthusiasm.

We have intensified activities to protect the environment also at European level, defining precise objectives: reduction of emissions generated, respect for the use of resources and optimization of waste management. At GLS, we always keep a close eye on innovations in the field of fuels. We have already converted part of our fleet of vehicles to natural gas and electric/hybrid traction. There are now also numerous types of ecological vehicles suitable for city deliveries to customers:

methane or electric vans and cargo bikes are, for example, vehicles that GLS already uses for deliveries in several cities.

The modernization of all our vehicles is a primary objective in order to achieve ever lower fuel consumption and thus limit CO2 emissions.

A further initiative in the direction of eco-sustainability is to replace the classic PVC shipping envelopes with new packaging made of recycled and recyclable plastic.
